

Data Security Platform to Set Your Data Free

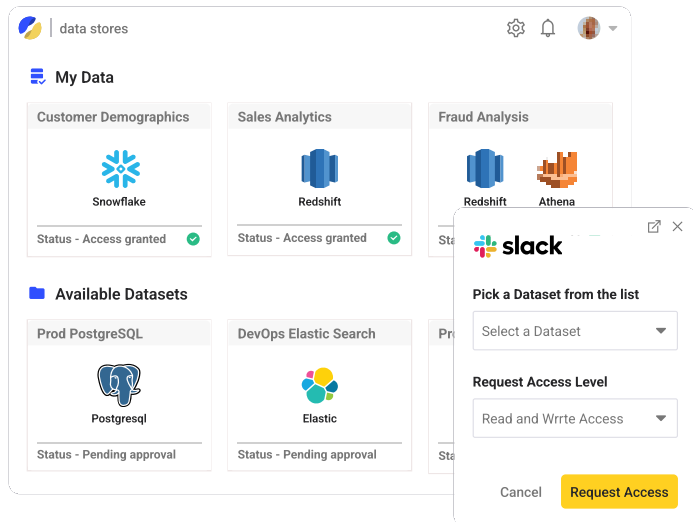

Unique data is your organization's greatest asset. The faster you extract value from your data, the greater the business impact. However, making it accessible to many users under various security, privacy and compliance requirements is slow and resource intensive and leads to risks such as over-privileged access to data.

Satori is a Data Security Platform that provides a first-of-its-kind Personalized Data Portal (PDP), where your users get access to the data they need when they need it. Satori's frictionless access to data, with built-in security and compliance accelerates time-to-value from data.

With Satori, you can quickly and easily implement self-service access to data across analytics and production environments. Your data users gain the ability to grant and revoke access to data in just a few clicks, while enforcing security best practices across all data platforms.

Key Capabilities

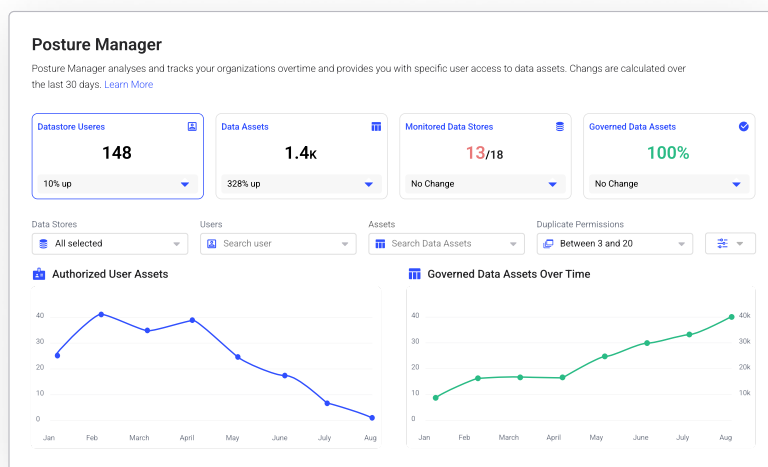

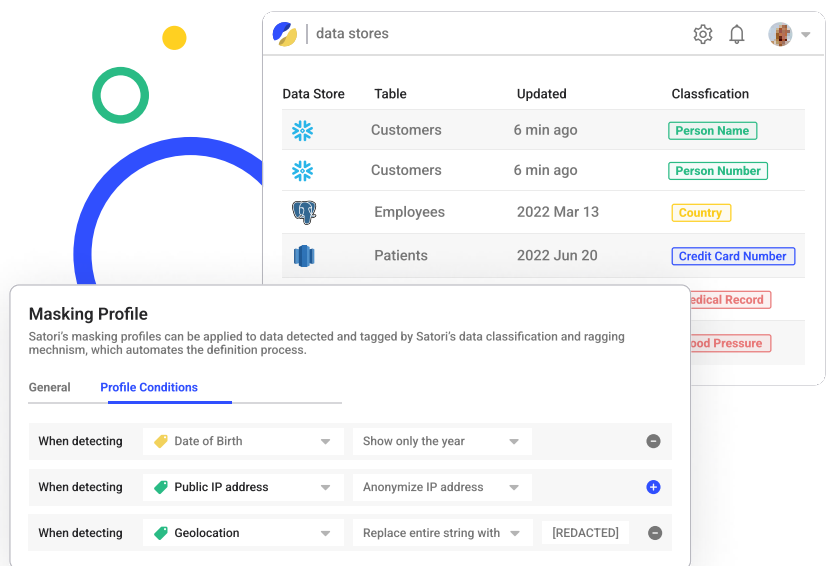

Self-service data access

Enable users to access data according to your security policies without engineering overhead through their own PDP, using convenient integrations with platforms like Slack, Salesforce or Jira.

Universal data security policies

Set and implement data security policies on all databases, data warehouses, and data lakes. Policies include data masking, revoke-after-use, data localization, and more.

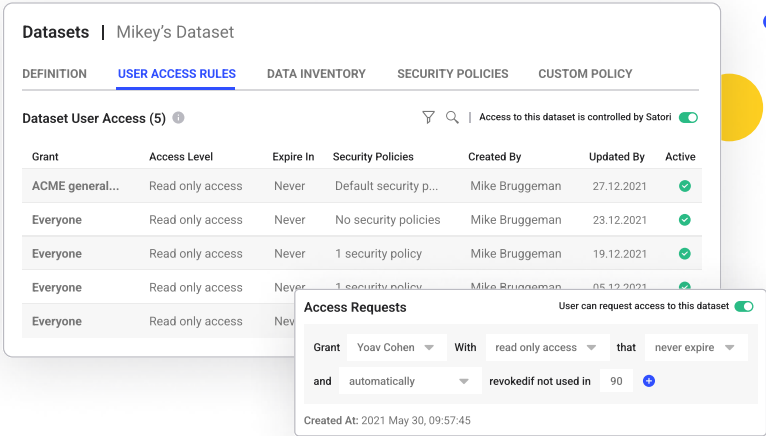

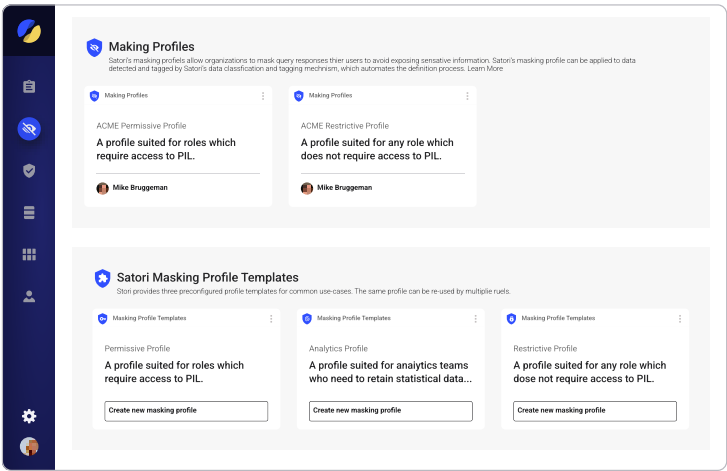

Data Security Posture Management

Know who is able to access your data, monitor authorization changes, and get analytics and KPIs to measure and improve your data security posture across all analytics and production environments.

RBAC and ABAC

Apply role-based as well as attribute-based access controls across all data platforms.

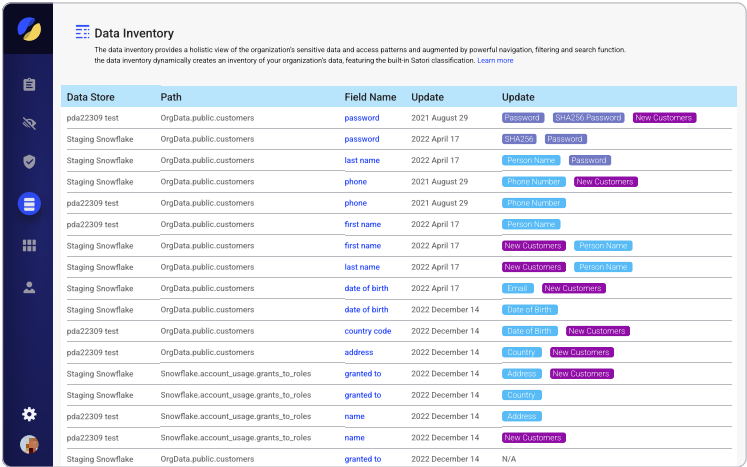

Visibility to all data access

Audit and monitor all data access across your databases, data warehouses, and data lakes. This includes the access of sensitive data and full identity information.

Sensitive data discovery and classification

Continuously discover and classify data assets and sensitive data. This results in a data inventory that is always-on, up-to-date with the location of all sensitive data, and applies security policies on any newly discovered sensitive data.

Zero Downtime, Manual Work, & Risk!

Oftentimes as new data is created new requirements emerge and new data users are introduced which limits organizations' ability to generate data value. Satori, on the other hand, automatically updates and adjusts PDPs through:

- ✓ The application of universal data access and security policies on all databases, data warehouses, and data lakes without writing any code.
- ✓ No changes to your existing queries or data models.
- ✓ Configuration at your pace, both out-of-the-box and incrementally.
- ✓ Full REST API and Terraform integration.

Faster Time-to-Value From Data

The continuous cycle of new users, data, and requirements makes it difficult for organizations to keep up and prevent data from becoming stagnant. Instead Satori keeps track of users, data and usage and as those change and security and compliance requirements evolve, Satori adapts, and keeps the data moving quickly to create greater time-to-value.

Built-In Security & Compliance

Satori enables faster and continuous compliance with regulations and frameworks such as GDPR, SOC 2, HIPAA, and more. With Satori you control and audit user access to production and analytic data, and easily eliminate unwanted and uncontrolled persistent access to sensitive data.

Wealthsimple

"The moment you make the secure way slightly more complicated or slower, people will go the non-secure way. You need to make secure data the fastest way of getting things done and that's what we do with Satori."

Dr. Diederik Van Liere VP Data Science and Engineering, Wealthsimple
